

## NHS England interim treatment options during the COVID-19 pandemic

These interim treatment options allow for greater flexibility in the management of cancer during the COVID-19 pandemic to ensure clinicians have additional treatment options through this time.

These interim treatment regimens are based on clinical opinion from members of the Chemotherapy Clinical Reference Group and specialised services cancer pharmacists and endorsed by NHS England and NHS Improvement. Each interim treatment change has been clinically assessed against the following criteria:

- a) the treatment is less immunosuppressive and thereby mitigates a patient's likelihood of becoming seriously ill during the coronavirus pandemic **or**
- b) the treatment can be administered at home or in a setting that reduces the patient's exposure to the coronavirus **or**
- c) the treatment is less resource intensive and makes better use of clinical capacity **and**
- d) the treatment is feasible; that is, it is not likely to require significant service change or additional training **and**
- e) there is likely to be adequate capacity in the relevant sector (such as home care providers) to deliver the treatment.

The responsibility for using these interim treatment regimens lies entirely with the prescribing clinician, who must discuss the risks and benefits of interim treatment regimens with individual patients, their families and carers.

All patients who start on an interim treatment during the COVID-19 pandemic should be allowed to continue the treatment until they and their clinician jointly decide it is appropriate to stop or to switch to a different treatment.

The ongoing need for each of the interim treatment options was reviewed at the end of 2021/22 by NHSE&I. Funding was agreed to continue for selected options during 2022/23 as:

- they or related drug indications are due for appraisal by NICE or assessment for an NHSE&I funding policy
- they make better use of clinical capacity, or
- they are valuable in protecting vulnerable patients with haematological malignancies who may have had a less than optimal response to COVID19 vaccinations.

This list will continue to be reviewed on a quarterly basis; the next review date is 30 June 2022.

Any interim treatment option listed below that is currently subject to an ongoing NICE technology appraisal will be superseded by the final appraisal document, which receives interim funding from the Cancer Drugs Fund, should this be published during the COVID-19 pandemic. In the case of a negative decision in an ongoing NICE technology appraisal, the interim treatment option will be withdrawn on publication of the final guidance.

Where a PAS (patient access scheme) is operational for any of the drugs listed below, it is expected that the PAS will continue to apply to all supplies and preparations as per the conditions of a simple discount PAS.

The 'all supplies and preparations' requirement includes any off-label uses. There are no arrangements that require the operational NHS to do anything additional.

If you have any queries about the interim treatment options, please email NHS England ([england.cdfteam@nhs.net](mailto:england.cdfteam@nhs.net)).

These interim treatment options do not constitute NICE guidance. When using this table, bear in mind that some regimens may not have a UK marketing authorisation for the use listed (for further information, see the [General Medical Council's guidance on prescribing unlicensed medicines](#)).

## Current interim treatment options

Indication	Interim treatment options
Acute myeloid leukaemia (AML)	<ul style="list-style-type: none"> <li>Option to use venetoclax with either low-dose cytarabine or azacitidine instead of standard intensive induction chemotherapy for patients with newly diagnosed acute myeloid leukaemia for whom standard intensive induction chemotherapy is <u>suitable</u>, to reduce the need for prolonged in-patient admission and reduce risk of neutropenia.</li> </ul>
Colorectal cancer	<ul style="list-style-type: none"> <li>The option to give intermittent treatment with chemotherapy regimens that contain cetuximab or panitumumab to reduce the need for immunosuppressive treatment. This remains in place but will be replaced by guidance in the new NHS England Treatment Break Policy expected in the first quarter of 2022/23.</li> </ul>
Gestational or placental site trophoblastic tumour	<ul style="list-style-type: none"> <li>Option to give pembrolizumab first-line or subsequent line instead of combination chemotherapy (change of sequence) to reduce the number of admissions and reduce the risk of neutropenia will remain until NHS England has reviewed its policy for <a href="#">Pembrolizumab for drug-resistant gestational trophoblastic neoplasia</a></li> </ul>

Indication	Interim treatment options
Lung cancer (non-small cell)	<ul style="list-style-type: none"> <li>Option to give dabrafenib plus trametinib for BRAF positive metastatic disease as an oral alternative to intravenous chemotherapy to reduce risk of immunosuppression and make better use of clinical capacity. This option will remain in place until NICE has appraised this indication.</li> </ul>
Lymphoma (Hodgkin)	<ul style="list-style-type: none"> <li>Option to give brentuximab earlier in treatment pathway to replace salvage chemotherapy, to reduce toxicity of treatment and number of admissions needed for intensive treatment.</li> </ul>
Lymphoma (non-Hodgkin)	<ul style="list-style-type: none"> <li>Option to give oral ibrutinib (with or without rituximab) first line instead of intravenous chemotherapy in patients with mantle cell lymphoma to reduce toxicity of treatment and number of admissions required.</li> </ul>
Mesothelioma	<ul style="list-style-type: none"> <li>The option to give nivolumab monotherapy instead of second line chemotherapy to reduce risk of immunosuppression. This remains in place but will be reviewed by NHS England once NICE has published its assessment of nivolumab and ipilimumab as a first-line option (see NICE <a href="#">ID1609</a>).</li> </ul>
Myeloma	<ul style="list-style-type: none"> <li>Option to give oral pomalidomide with dexamethasone as second- or third-line therapy instead of intravenous treatments in patients previously treated with lenalidomide to reduce the need for chemotherapy, reduce admissions and risk of neutropenia.</li> <li>The option to give second-line ixazomib with lenalidomide and dexamethasone for patients who are neither refractory to previous proteasome inhibitor-based treatment nor to lenalidomide-based treatment if contained within the first line of therapy already received. This option remains in place but will be reviewed by NHSE&amp;I once NICE has completed its review of the CDF-funded third-line indication (see NICE <a href="#">ID1635</a>).</li> </ul>
Ovarian cancer	<ul style="list-style-type: none"> <li>Option to give trametinib for advanced low grade serous ovarian carcinoma as oral alternative to intravenous chemotherapy to reduce risk of immunosuppression and make better use of clinical capacity. This will remain in place until the outcome of the NHSE&amp;I policy proposal is known.</li> </ul>
Upper gastrointestinal cancers (oesophagogastric, small bowel, biliary tract, pancreatic)	<ul style="list-style-type: none"> <li>Option to give nivolumab instead of chemotherapy for microsatellite instability-high tumours to reduce toxicity of treatment in patients with oesophagogastric tumours who are ineligible for pembrolizumab (<a href="#">TA737</a>) and those with upper gastrointestinal cancers of small bowel, biliary tract and pancreatic origin. This</li> </ul>

<b>Indication</b>	<b>Interim treatment options</b>
	will remain in place until the outcome of the NHSE&I policy proposal is known.

## Interim treatment options that have been removed by NHS England or have been superseded by NICE technology appraisal committee decisions

Indication	Treatment options that have been removed by NHS England or have been superseded by NICE technology appraisal committee decisions
General	<ul style="list-style-type: none"> <li>The general advice regarding prophylactic granulocyte-colony stimulating factors for regimens with greater than 10% risk of neutropenic fever was removed by NHS England on 25 March 2021 as clinicians are free to prescribe within current routine commissioning arrangements.</li> </ul>
Acute myeloid leukaemia (AML)	<ul style="list-style-type: none"> <li>Use of gilteritinib for relapsed/refractory FLT3+ acute myeloid leukaemia was superseded on 16 July 2020 (see <a href="#">TA642</a>) and availability is governed by usual funding processes.</li> </ul>
Bladder cancer	<ul style="list-style-type: none"> <li>The option to use atezolizumab as first-line immunotherapy instead of chemotherapy to reduce the number of admissions and reduce the risk of neutropenia was removed by NHS England on 1 April 2022 as it is no longer needed.</li> </ul>
Breast cancer	<ul style="list-style-type: none"> <li>Use of atezolizumab for triple negative metastatic breast cancer instead of chemotherapy was superseded on 22 May 2020 (see <a href="#">TA639</a>) and availability is governed by usual funding processes.</li> <li>Option to suspend treatment with adjuvant bisphosphonates to reduce inpatient visits was removed by NHS England on 21 September 2020.</li> <li>The option to consider reducing the duration of adjuvant trastuzumab monotherapy from 12 months to 6 months was removed by NHS England on 25 March 2021. This may be less effective than standard therapy for patients at higher risk of recurrence and it is no longer needed due to lower rates of coronavirus infection.</li> <li>The option to consider giving pertuzumab plus trastuzumab for neo-adjuvant therapy, adjuvant therapy, locally recurrent or metastatic disease without chemotherapy was removed by NHS England on 25 March 2021. This may be less effective than standard therapy for patients at higher risk of recurrence and it is no longer needed due to lower rates of coronavirus infection.</li> <li>The option to switch to oral capecitabine from intravenous taxanes with anti-HER2 therapies for metastatic disease to reduce the risk of neutropenia was removed by NHS England on 25 March 2021 as</li> </ul>

	<p>clinicians are free to prescribe within current routine commissioning arrangements.</p> <ul style="list-style-type: none"> <li>The option to substitute albumin-bound paclitaxel (Abraxane) for paclitaxel or docetaxel to reduce toxicity and potential for admission was removed by NHS England on 1 April 2022 as it is no longer needed in this guideline because it is available as part of base line funding.</li> </ul>
Colorectal cancer	<ul style="list-style-type: none"> <li>Option to give encorafenib and cetuximab for BRAF positive metastatic disease instead of chemotherapy to reduce risk of immunosuppression was superseded on 20 November 2020 (see <a href="#">TA668</a>). Availability is governed by usual funding processes.</li> <li>Option to give pembrolizumab as immunotherapy instead of chemotherapy for previously untreated metastatic colorectal cancer with high levels of microsatellite instability and/or deficient mismatch repair was superseded on 14 May 2021 (see <a href="#">TA709</a>). Availability is governed by usual funding processes.</li> <li>Option to give nivolumab as immunotherapy instead of chemotherapy for previously treated metastatic colorectal cancer with high levels of micro-satellite instability and/or deficient mis-match repair to reduce the number of admissions and reduce the risk of neutropenia was replaced on 28 July 2021 by NICE guidance for nivolumab with ipilimumab in the same indication (see <a href="#">TA716</a>). Availability is governed by usual funding processes.</li> </ul>
Endometrial cancer	<ul style="list-style-type: none"> <li>Option to give nivolumab instead of chemotherapy for microsatellite instability-high tumours to reduce toxicity and risks of treatment replaced on 8 February 2022 by NICE FAD for dostarlimab for previously treated advanced or recurrent endometrial cancer with high microsatellite instability or mismatch repair deficiency</li> </ul>
Head and neck cancer	<ul style="list-style-type: none"> <li>Option to give pembrolizumab as first-line immunotherapy instead of chemotherapy for head and neck cancers to reduce the number of admissions and reduce the risk of neutropenia was superseded on 22 October 2020 (see <a href="#">TA661</a>). Availability is governed by usual funding processes.</li> </ul>
Lung cancer (non-small cell)	<ul style="list-style-type: none"> <li>Option to give osimertinib as first-line therapy to delay the need for subsequent chemotherapy was superseded on 11 September 2020 (see <a href="#">TA654</a>) and availability is governed by usual funding processes.</li> </ul>

	<ul style="list-style-type: none"> <li>• Advice to switch to carboplatin and paclitaxel from day 8 treatments such as gemcitabine and carboplatin and cisplatin and vinblastine was removed by NHS England on 6 November 2020 because clinicians are able to make this choice for individual patients within the commissioned pathway.</li> <li>• Allow durvalumab to be given 4-weekly in patients eligible for durvalumab following treatment with chemo-radiotherapy to reduce the number of hospital visits was removed by NHS England on 25 March 2021. This dosing schedule is now licensed, and clinicians are free to prescribe within current routine commissioning arrangements.</li> <li>• Option to stop maintenance pemetrexed in combination with pembrolizumab to reduce treatment toxicity and risk of neutropenia was removed on 30 June 2021 as patients can receive standard therapy so the need for this option has reduced.</li> <li>• Option to give pembrolizumab as a single agent as a first-line treatment for squamous or non-squamous non-small cell lung cancer and a PDL-1 score of less than 50% to reduce treatment toxicity and risk of neutropenia was removed on 30 June 2021 as patients can receive standard therapy so the need for this option has reduced.</li> </ul>
Lung cancer (small cell)	<ul style="list-style-type: none"> <li>• Advice to stop first-line chemotherapy for stage 4 small cell lung cancer after 4 cycles to reduce hospital admission and risk of neutropenia was removed by NHS England on 6 November 2020 because clinicians are able to make this choice for individual patients within the commissioned pathway.</li> </ul>
Lymphoma (Hodgkin's)	<ul style="list-style-type: none"> <li>• The option to give nivolumab earlier in treatment pathway – after brentuximab to replace salvage chemotherapy – to reduce admission time and reduce risk of neutropenia was removed by NHS England on 1 April 2022 as it is no longer needed.</li> </ul>
Lymphoma (non-Hodgkin)	<ul style="list-style-type: none"> <li>• Use of polatuzumab (in combination with bendamustine and rituximab) for diffuse large B-cell lymphoma as bridging therapy for patients approved for CAR-T therapy, both before and after apheresis, was superseded on 20 August 2020 (see <a href="#">TA649</a>) and availability is governed by usual funding processes.</li> <li>• Consider suspending rituximab maintenance to avoid patients attending hospital in the event of high rates of coronavirus infection was removed on 30 June 2021 because clinicians are able to make this</li> </ul>

	<p>choice for individual patients within the commissioned pathway.</p> <ul style="list-style-type: none"> <li>• Consider suspending obinutuzumab maintenance to avoid patients attending hospital in the event of high rates of coronavirus infection was removed on 30 June 2021 because clinicians are able to make this choice for individual patients within the commissioned pathway.</li> <li>• Option to switch intravenous rituximab to subcutaneous rituximab in follicular lymphoma patients receiving rituximab with lenalidomide to reduce the time patients spend in hospital was removed on 30 June 2021 because subcutaneous rituximab option is now established as part of routine commissioning in this indication.</li> </ul>
Melanoma	<ul style="list-style-type: none"> <li>• Advice to use oral therapy as first-line treatment for BRAF-positive patients in preference to immunotherapy to reduce admission for intravenous therapy was removed by NHS England on 6 November 2020 because clinicians are able to make this choice for individual patients within the commissioned pathway.</li> <li>• Stop immunotherapy doublet (ipilimumab and nivolumab) and switch to single agent nivolumab or pembrolizumab to reduce toxicity was removed by NHS England on 21 September 2020 because clinicians are able to make this choice for individual patients within the commissioned pathway.</li> </ul>
Myeloma	<ul style="list-style-type: none"> <li>• The option to give first-line lenalidomide and dexamethasone for transplant eligible myeloma patients in preference to regimens that need more hospital attendances and parenteral administrations to reduce toxicity of treatment and number of admissions needed for treatment was removed by NHS England on 1 April 2022 as it is no longer needed because of the availability of alternative options for transplant-eligible patients (see <a href="#">TA763</a> daratumumab in combination).</li> <li>• Option to give lenalidomide as second-line treatment in patients with multiple myeloma previously not treated with a first-line bortezomib-containing regimen treatment was removed by NHS England on 1 April 2022 as it is longer needed.</li> </ul>
Neuroendocrine tumours	<ul style="list-style-type: none"> <li>• Option to give oral temozolomide and capecitabine instead of intravenous streptozocin and 5-fluorouracil to reduce toxicity and admissions for treatment was removed on 30 June 2021 because</li> </ul>

	<p>this option is now established as part of routine commissioning.</p>
Ovarian cancer	<ul style="list-style-type: none"> <li>The option to give olaparib, niraparib or rucaparib (poly-ADP-ribose [PARP] inhibitors) instead of chemotherapy plus maintenance PARP inhibitor at first relapse for BRCA-positive PARP-naive patients to reduce admissions and risk of neutropenia in the event of high rates of coronavirus infection was removed by NHS England on 25 March 2021. These may be less effective than standard therapy and are no longer needed due to lower rates of coronavirus infection.</li> </ul>
Prostate cancer	<ul style="list-style-type: none"> <li>The option to give enzalutamide with androgen deprivation therapy for patients with newly diagnosed metastatic disease instead of docetaxel to reduce toxicity and potential for admission was superseded on 8 June 2021 (see <a href="#">TA712</a>). Availability is governed by usual funding processes</li> <li>Patients with enzalutamide intolerance are now given the option of switching treatment to apalutamide (see <a href="#">TA741</a>) with androgen-deprivation therapy if they have newly diagnosed metastatic disease who are ineligible for docetaxel. Therefore, the option for patients with enzalutamide intolerance in this indication to switch to abiraterone was removed by NHS England on 1 April 2022.</li> </ul>
Renal cell cancer	<ul style="list-style-type: none"> <li>Option to delay use of first-line nivolumab with ipilimumab to second or subsequent line of therapy. This is to allow intermediate and poor risk groups patients to choose oral therapy options to reduce toxicity and potential for admission was removed on 30 June 2021 as patients can receive standard therapy so the need for this option has reduced.</li> <li>Option to delay use of second-line nivolumab to third-line or subsequent line therapy. This is to allow intermediate and poor risk groups patients to choose oral therapy options to reduce toxicity and potential for admission was removed on 30 June 2021 as patients can receive standard therapy so the need for this option has reduced.</li> </ul>
Upper gastrointestinal cancers (oesophageal, gastric)	<ul style="list-style-type: none"> <li>The option to give nivolumab instead of chemotherapy for microsatellite instability-high tumours to reduce toxicity of treatment was removed for the subset of upper gastrointestinal patients with oesophagogastric tumours who are eligible for pembrolizumab (<a href="#">TA737</a>) by NHSE&amp;I on 1 April 2022.</li> </ul>
